

Our Story

From 1840 to 1900, 160 million board feet of lumber were harvested from the vast forests of Michigan. Competing sawmills were forced to share the waterways to move their lumber to market, with thousands of logs floating down the rivers competing lumber mills utilized specialized marks, called CatchMarks, to make the process of identifying, organizing, and preparing lumber for market possible. Today's technology environment shares many similarities to the lumber era. There are thousands of products and providers to choose from, and it is tough to identify and implement technology solutions on your own. Much like the specialized marks used to aid in the complex task of the lumber harvest, CatchMark Technologies can help your business navigate the complexities of implementing technology solutions.

About Company

CatchMark is a full service MSP (Managed Service Provider) and so much more. By merging small town values like honesty, integrity, and reliability with high tech ingenuity, efficiency, and innovation CatchMark is able to master and employ the latest technology solutions for our customers.
